Danielle Gosselin
Acting Director
Office of Environmental Analysis
Surface Transportation Board
395 E Street, SW
Washington, DC 20423

Re: Docket No. FD 36500, Response to Information Request No. 2

Dear Ms. Gosselin:

On behalf of our client, Canadian Pacific Railway Limited, this letter and the attached tables respond to the Office of Environmental Analysis's Information Request No. 2.

Several of OEA's requests ask for pre- and post-acquisition estimates. As it did in response to Information Request No. 1, CP is providing three data sets: actual numbers from 2019 (the last pre-pandemic year), projections for 2027 without the merger, and projections for 2027 with the merger. This allows OEA to see the effects of the merger in the context of future traffic levels that account for organic traffic growth.

REQUEST A

Request A covers information about the locomotives, train consists, and track on segments where CP's traffic projections exceed the Board's environmental review thresholds. The request recognizes that any post-acquisition information CP provides is inherently an estimate. CP is basing its estimates on the best information it currently has available, as explained in the responses to each individual inquiry.

A.1 – Train information

Request A.1 asks for pre- and post-acquisition estimates of: (1) the average number of locomotives per train; (2) the average number of railcars per train; and (3) the average total length of trains.

Table 1 presents the average train length, average number of railcars per train, and the average number of locomotives per train in 2019, as well as projections for 2027 with and without the merger. Table 1 includes every subdivision where one or more segments exceed the Board's thresholds.

A.2 – Speed

Request A.2 asks for the average pre- and post-acquisition train speeds on segments where traffic projections exceed the Board's thresholds. Many conditions can affect the speed of an individual train on a given day, including, among many other things: track speed and speed restrictions, signal conditions, weather, other train traffic encountered (meets and passes), the train's dispatch priority, and maintenance work on the route. With that in mind, Table 2 presents the average train speed in 2019 on each subdivision having segments that exceed the Board's thresholds, as well as the projected average train speeds in 2027 with and without the merger.

A.3 – Locomotive Emissions Certification

Request A.3 asks CP to estimate the proportion of locomotives in each EPA emissions tier that will travel on segments where traffic projections exceed the Board's thresholds. As detailed in the Operating Plan submitted as Exhibit 13 of the Merger Application, the combined CPKC will control (own or lease) 2,421 locomotives with an average age of 22 years. The approximate distribution of locomotives among the EPA emission tiers is:

EPA Tier	N/A	TIER-0	TIER-0+	TIER-1+	TIER-1+C	TIER-2	TIER-2+	TIER-3	TIER-3+C	TIER-4	TOTAL
Approximate Percentage of Fleet	8	6	18	24	8	7	19	8	1	1	100

Given the fluid nature of rail operations, locomotives tend to travel across the entire network rather than being dedicated to a single region. In addition, as described in

the Operating Plan, CP expects that in the initial years after the merger, CPKC will have an excess of locomotives. That will allow CPKC to optimize locomotive assignments to the fleet's newest, most fuel-efficient members. The locomotive surplus will also allow CPKC to continue remanufacturing older locomotives into more fuel-efficient units that could come online in time to meet anticipated traffic growth.

A.4 – Special trackwork

Request A.4 asks for GIS data showing the “locations of special trackwork” on segments where traffic projections exceed the Board's thresholds. CP has uploaded this GIS data to the SharePoint Site maintained by OEA's Third-Party Contractor, VHB.

Request A.4 also asks whether any segments that exceed the Board's thresholds will use rail types other than continuous-welded rail. CP states that all such segments are continuous-welded rail except that the Alliance subdivision and the White Rock branch in the Dallas area have some jointed rail.

A.5 – Siding dwell time

Request A.5 asks CP to estimate the average pre- and post-acquisition dwell time for passing sidings on segments where traffic projections exceed the Board's thresholds. CP recognizes the inconvenience that blocked crossings cause, and it is committed to minimizing dwell times whenever practicable. For instance, when a train meet is planned at a siding with a crossing, CP paces its trains so they don't have long to wait on the siding before the passing train arrives. If a train will occupy a siding with a crossing for a longer time, CP often splits the train at the crossing so it will not impede traffic.

Table 3 presents the average pre- and post-acquisition dwell times for each siding on the subdivisions which contain segments that exceed the Board's thresholds (regardless whether the siding bisects crossings). Table 3 does not include new sidings that CP anticipates adding after the merger, but CP expects 2027 post-acquisition dwell times on those new sidings to be comparable to those for existing sidings on the same subdivision. Table 3 also excludes sidings between Beaumont and Rosenberg, Texas, and between Robstown and Victoria, Texas, where KCS operates via trackage rights over track dispatched by Union Pacific. CP has no reason to believe that dwell times on those sidings will change.

REQUEST B

Request B seeks information about the four rail yards where CP projects exceedances of the Board’s environmental review thresholds (i.e., Bensenville, Schiller Park, Detroit Container Terminal, and Wylie). Again, insofar as the request asks about post-acquisition traffic, CP can respond only with estimates. The bases of those estimates are described below.

B.1 – Switch engine operating hours

Request B.1 asks for estimates of pre- and post-acquisition daily switch engine operating hours. The table below shows the average daily switch engine hours of operation in 2019 and estimates those hours for 2027 with and without the merger.

	Switch Engine Hours Per Day		
	2019	2027 Without Merger	2027 With Merger
Wylie	42.4	42.4	42.4
Bensenville	148.4	141.3	141.3
Detroit Cont. Term.	10.6	10.6	10.6
Schiller Park	Included in Bensenville Metrics (No Yard Jobs)		

B.2 – Rail cars switched per hour

Request B.2 asks CP to estimate the number of rail cars switched per hour of switch engine operation. Those estimates appear in the table below.

	Cars Switched Per Hour of Switch Engine Operation		
	2019	2027 Without Merger	2027 With Merger
Wylie	31.2	35.2	39.4
Bensenville	18.8	26.8	29.9
Detroit Con. Term.	5.6	6.3	11.3
Schiller Park	Included in Bensenville Metrics (No Yard Jobs)		

B.3 – Switch engine EPA tiers

Request B.3 asks CP to provide pre- and post-acquisition switch engine EPA tiers and average fuel efficiency.

As detailed in the Operating Plan included as Exhibit 13 of the Merger Application, the combined CPKC will control 806 switching locomotives with an average age of 34 years. The approximate breakdown between EPA emissions tiers is:

EPA Tier	N/A	TIER-0	TIER-0+	TIER-1+	TIER-1+C	TIER-2	TIER-2+	TIER-3	TIER-3+C	TIER-4	TOTAL
Approximate Percentage of Switch Fleet	23	23	52	0	0	2	0	0	0	0	100

Given the fluid nature of rail operations, switch locomotives do not stay in a single yard or terminal. Rather, they are moved between locations as business needs and locomotive maintenance requirements dictate. In addition, as described in the Operating Plan, CP expects that in the initial years after control approval, CPKC will have an excess of locomotives. That will allow the railroad to optimize locomotive assignments to the fleet’s newest, most fuel-efficient members. The locomotive surplus will also allow CPKC to continue remanufacturing older locomotives into more fuel-efficient units that could come online in time to meet anticipated traffic growth.

The combined CPKC switch locomotive fleet will include at least 12 models of 4-axle locomotives. To estimate fuel consumption, CP used the GP20 ECO Locomotive. CP currently operates 130 of these locomotives, and it will be the combined fleet’s most common 4-axle model. Because a switch locomotive’s fuel consumption also depends on its throttle position, CP used the EPA Switch Cycle to estimate the proportion of time spent in each throttle position. With those assumptions, shown below, average fuel consumption is 9.40 gal/h.

Throttle Setting	DB1	L. Idle	Idle	N1	N2	N3	N4	N5	N6	N7	N8
GP20 ECO (gal/h in each throttle setting)	3.3	1.4	1.4	5.9	11	23.9	32.4	51.5	72.2	86.4	102.3
EPA Switch Cycle (% of time in each throttle setting)	0.0%	29.9%	29.9%	12.4%	12.3%	5.8%	3.6%	3.6%	1.5%	0.2%	0.8%
Weighted Average Fuel Consumption (gal/h)	9.40										

B.4 – Emissions from line-haul locations

Request B.4 asks for block-swapping information about the four rail yards that exceed thresholds. The request indicates that OEA plans to use this information to estimate emissions from line-haul locations that perform block swapping.

Block swapping activities are routine and unrelated to yard activity, often taking place at considerable distance from the rail yard. To illustrate: For traffic originating from Bensenville, there are 47 different en route block-swap locations, including at locations as close as Rockford, IL (approximately 60 miles west) and as far away as Laredo Yard and Mexico City. For traffic destined to Bensenville, there are 18 different en route block-swap locations, the closest being IFG near Kansas City and the farthest away being Laredo Yard and Mexico City. In all, there are 73 distinct block-swap locations associated with the four yards that exceed the Board's thresholds.

- i. Table 4 shows all of the block-swap locations associated with the four yards that exceed the Board's thresholds. For each of those locations, the table identifies every swap that originates or terminates at one of the four yards, as well as the subdivision and segment of each block swap location.
- ii. The gross tonnage of block swap traffic is included in the total gross tonnage for each segment shown in the Master Segment Table, which was included as part of CP's response to Information Request No. 1.
- iii. The length of the rail line segments is also presented in the Master Segment Table.
- iv. The gross tonnage of block swap traffic entering the four rail yards is included in the total gross tonnage for the rail line segment adjacent to the rail yard in the Master Segment Table. The handling of the block swap cars is captured within the car handling counts presented in the Master Yard Table that CP included as part of its reply to Information Request No. 1.

B.5 – Wheel retarders

Request B.5 asks which of the four rail yards use wheel retarders. None of the four rail yards (Bensenville, Schiller Park, Detroit Container Terminal, and Wylie) use wheel retarders.

REQUEST C

Request C asks for more information about capital improvements. These capital improvements are not part of the proposed merger; they were included in CP's response to Information Request No. 1 as reasonably foreseeable connected actions. The capital improvements will be built only as needed based on increasing traffic.

While CP has done its best under the circumstances to identify the locations of the capital improvements, it has not performed design-level engineering. That engineering process cannot and will not occur until the capital improvements are ready to be built. In light of these uncertainties, in responding to Request C, CP is offering the best available information, recognizing that future conditions in the field may require some of the capital improvements to be adjusted.

C.1 – Construction and use of improvements

Request C.1 asks for information about the construction and use of capital improvements, to the extent it is available. For purposes of this environmental review, CP conducted a field review of the proposed capital improvements sites. Its responses are based on the information it collected. When the improvements are constructed, CP will perform additional engineering and will comply with all applicable regulations.

- i. CP is providing OEA with electronic roll plots showing which side of the mainline it plans to use for each capital improvement.
- ii. The electronic roll plots also identify the width of the existing right-of-way. CP does not anticipate needing additional right-of-way width.
- iii. When the construction footprint for the capital improvements differs from the footprint of the new track, that is also shown in the electronic roll plots.
- iv. Water crossing designs cannot be known with certainty until CP performs design-level engineering for the capital improvements. The electronic roll plots include preliminary water crossing designs.
- v. CP expects that the maximum authorized train speed on the planned double track and facility working track will match the existing mainline track speed in those locations: 40 mph for the Blue Valley Double Track and 55 mph for the Grandview/IFG Facility Working Track.

C.2 – Construction access

CP and KCS can confirm that they intend to access construction locations associated with capital improvements using the existing rail right-of-way and existing roads and road crossings, including existing road rights-of-way where the road right-of-way is adjacent to the rail right-of-way.

C.3 – Construction activities

CP and KCS can confirm that they intend to confine construction areas, including equipment staging and laydown areas, to the existing rail right-of-way.

REQUEST D

Request D asks for information about intermodal facilities projected to see either (a) 50 new trucks per day or (b) a 10 percent increase in average daily truck traffic as a result of the proposed transaction.

D.1 – Intermodal facilities

The traffic projections submitted in response to Information Request No. 1 indicate that truck traffic at six intermodal facilities would increase by 50 trucks per day, 10 percent of the average number of trucks per day, or both:

Terminal	State	2019	2027 Without Merger	2027 With Merger	Truck Per Day Increase	Percentage Increase
BENSENVILLE IMS	IL	303	383	698	315	82%
DETROIT CONTAINER TERMINAL	MI	111	141	228	87	62%
MINNEAPOLIS IMS	MN	221	279	332	53	19%
SCHILLER EAST IMS	IL	150	190	324	134	70%
INTERNATIONAL FREIGHT GATEWAY	MO	41	51	104	53	103%
JACKSON	MS	5	6	6	0	0%
KENDLETON	TX	9	12	12	0	0%
LAREDO	TX	25	31	31	0	0%
WYLIE	TX	258	326	474	148	45%

D.2 – Additional information

For the six facilities identified in the previous response, CP is providing the requested information in Table 5, which uses the same format as OEA’s template.

REQUEST E

Request E asks for summary information about hazardous materials. CP's response to Information Request No. 1 already showed that hazardous materials will be a small fraction of the carloads moved on the combined CP-KCS system. And of all the ways those hazardous materials can move, rail is among the safest. Over 99.99% of hazardous material shipments by rail reach their destination without release. Every year, CP and KCS move hundreds of thousands of such shipments safely.

E.1 – Types of hazardous materials

The types of hazardous materials transported on the CP and KCS networks is not up to the railroads. Because CP and KCS are common carriers, they are legally required to transport any railcar that a shipper properly offers and pays for. At present, that includes commodities from all nine hazard classes. The most common of these is Class 3 (flammable liquids), which annually makes up over 50% of hazardous material shipments.

Additional volumes of certain hazardous commodities are expected on the combined CPKC network after the merger. But the great majority of that hazardous material traffic is already moving by rail on the lines of other carriers. The efficiencies created by the merger will simply shift hazardous material traffic from those other carriers to CPKC.

As discussed in the Brown/Zebrowski Verified Statement filed with the Merger Application, the expected merger-related hazardous material increase on the CPKC network is driven by three key diversions of rail traffic now moving on other Class I carriers: (1) the movement of liquefied petroleum gas from Alberta and other production regions to Mexico; (2) the movement of products from Gulf-Coast chemical plants to the areas where they are used; and (3) the transportation of bitumen and crude oil from Alberta to the Gulf Coast. The merger is also expected to accelerate the shift away from flammable crude oil toward non-hazardous "DRUbit," from which the flammable diluent has been removed. *See Wahba/Naatz Verified Statement (filed with the Merger Application).*

E.2 – Hazardous materials releases

Table 6 provides the records of CP's and KCS's hazardous material releases in the US between 2015 and 2019. Combining CP and KCS data from that five-year period gives 233 releases. Of those, more than 50% were 50 gallons or less, and more than 45% were 10 gallons or less.

The table below presents CP's and KCS's FRA-reportable train accident frequency between 2015 and 2019 (FRA reportable train accidents per million train miles). CP is extremely proud to have had the lowest FRA reportable incident frequency among Class I Carriers for 15 straight years.

Railroad	2015	2016	2017	2018	2019
KCS	4.02	2.62	3.68	3.41	2.85
CP	1.41	1.12	0.99	1.1	1.06

Thank you for your hard work on the environmental review process. Please do not hesitate to contact me if you have any questions.

Sincerely,

Kathryn K. Floyd

Notes

- 2027 Without Merger Trains are calculated using Base Trains and Organic Bulk Growth Trains. There is no train design change for 2027 Without Merger.
- 2027 Without Merger is calculated from the organic growth rates used in the modelling behind the Operating Plan (Merger Application Exhibit 13) plus 2 years to year 5. Equates to ~26% above 2019 levels.
- Locomotives/Train based on projected Horsepower Per Ton relative to increase in train lengths.

Table 2 : Average Train Speeds Across Subdivisions Which Contain Segments Which Exceed The Board's Thresholds

Subdivision	2019 Actual (mph)	2027 Without Merger (mph)	2027 With Merger (mph)
CHICAGO	18.7	19.9	22.9
DAVENPORT	11.8	12.5	14.5
OTTUMWA	17.7	18.8	21.7
CP LAREDO	17.1	18.2	21.0
KANSAS CITY	18.4	19.5	22.5
KC TERMINAL	13.4	13.4	16.4
PITTSBURG	15.1	15.1	18.4
HEAVENER	14.0	14.0	17.0
SHREVEPORT	17.8	17.8	21.7
SHREVEPORT TERMINAL	17.2	17.2	21.0
BEAUMONT	14.3	14.3	17.5
HOUSTON TERMINAL	9.8	9.8	11.9
ROSENBERG	11.2	11.2	13.6
KCS LAREDO	11.0	11.0	13.4

Assumptions for CP Subdivisions:

- 2027 Without Merger - 1% per year increase in speed - system level estimate. Does not include additional capacity (CTC)
- 2027 With Merger - improvements in network capacity (CTC) will drive reductions to average delay, lift speed
- Assumes proxy of ~92% of Calgary to Moose Jaw speed as a proxy; 92% based on the difference between 60 mph track and 55 mph track
- Assumption that track speed will be increased to 55 mph on the Chicago to KC corridor in 2027 with merger case

Assumptions for KCS Subdivisions:

- 2027 Without Merger - same average speed as 2019.
- 2027 With Merger - improvements in network capacity will offset the impact of increased volumes - improvement in speed per the system level targets with increased PSR application.

Table 3: Average Dwell Time in Sidings on Segments Which Exceed the Board's Thresholds

Assumptions fo CP Subdivisions:

- 2027 Without Merger - same average delay as in 2019 - assumption that changes to facilitate improved meets will not occur (installation of CTC)
- 2027 with Merger - improvements in network capacity (CTC) will drive reductions to average delay - 14 minutes per meet.

Assumptions for KCS Subdivisions:

- 2027 No Merger - same average delay as 2019.
- 2027 with Merger - improvements in network capacity will offset the impact of increased volumes - no change anticipated to overall siding delays.

Table 4: Block Swap Locations for Traffic Blocks Associated With The Four Yards Which Exceed The Board's Thresholds
